THE PULTRUSION PROCESS

Pultrusion is a manufacturing process for producing continuous lengths of reinforced polymer structural shapes with constant cross-sections. Raw materials are a liquid resin mixture (containing resin, fillers and specialized additives) and flexible textile reinforcing fibers. The process involves pulling these raw materials (rather than pushing, as is the case in extrusion) through a heated steel forming die using a continuous pulling device. The reinforcement materials are in continuous forms such as rolls of mat and doffs of roving. As the reinforcements are saturated with the resin mixture ("wet-out") in the resin bath and pulled through the die, the gelatin or hardening, of the resin is initiated by the heat from the die and a rigid, cured profile is formed that corresponds to the shape of the die. While pultrusion machine design varies with part geometry, the basic pultrusion process concept is described in the following schematic.

The creels position the reinforcements for subsequent feeding into the guides. The reinforcement must be located properly within the composite and this is the function of the reinforcement guides.

The resin bath saturates (wets out) the reinforcement with a solution containing the resin, fillers, pigment, and catalyst plus any other additives required. The interior of the resin bath is carefully designed to optimize the wet-out of the reinforcement.

On exiting the resin bath, the composite is in a flat sheet form. The performer is an array of tooling which squeezes away excess resin as the product is moving forward and gently shapes the materials prior to entering the forming and curing die. In the forming and curing die, the thermosetting reaction is heat activated (energy is primarily supplied electrically) and the composite is cured (hardened). On exiting the die, it is necessary to cool the hot part before it is gripped by the pull blocks (made of durable urethane foam) to prevent cracking and/or deformation by the pull blocks. Strong well uses two distinct pulling systems, one that is a caterpillar counter-rotating type and the other a hand-over-hand reciprocating type to pull the cured profile to the saw for cutting to length.

CABLE TRAY

Per the National Electrical Code, a cable tray system is "a unit or assembly of units or sections and associated fittings forming a rigid structural system used to securely fasten or support cables and race ways". Composite cable trays are fabricated from components derived from a process called PULTRUSION. This process enables a high percentage of reinforcement to be incorporated into the components giving it very superior strength. The strength of it in relation to its weight therefore exceeds the performance of those of steel or aluminum. Composite cable trays are made from a selection of premium resin reinforced with reinforcements to form a strong composite which is resistance to must chemicals and ultra violet. Composite cable tray resists acids, salts, alkalis and a wide range of aggressive chemicals and solvents. They are also available in fire retardant grade.

DIFFERENT TYPES OF CABLE TRAYS ARE:

1) Ladder type FRP cable trays:

2) Box type FRP cable trays:

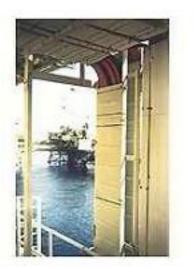

Office: Iran, Tehran, Ressalat Expy, Bani Hashem st, Sepideh Alley, No.6, Unit 53

APPLICATIONS OF CABLE TRAYS

Applications:

- Chemical and purification plants
- Refineries
- Tunnels
- Effluent treatment plants
- Marine industry
- Metallurgical plants
- Fertilizer plants
- Oil & Gas sector
- Food & Drag industry etc.

Users:

- Railway cable laying
- Telephone cable laying
- Electrical cable laying
- Protection of medium and low tension cable on walls or poles

Benefits and Characteristics of FRP Cable Trays

- Corrosion Resistance
- Fire Resistance
- Non-Magnetic
- Impact Resistance
- Non-sparking
- Maintenance Free
- Light Weight
- Cost Saving
- Non-Conductive
- Low Installation Costs
- Superior Strength

DESCRIBTION

Mechanical Strength

- High Performance
- Easily Worked
- Cut and drilled on site
- Easy to install
- Long Life
- Non rust
- Nor do they ever require painting
- Resistance to most chemicals
- Gives added fire protection to the cables in case of external fire

CORROSION RESISTANCE

The ability of Composite Cable tray is to guard against deterioration from industrial chemicals and environmental factors makes it a logical and cost-effective alternative to carbon steel, aluminium or other conventional materials also it is resistance to weather and UV. Whether Cable tray is exposed to continuous submersion, splash, spills, fumes or gases, you can be assured that Composite Cable tray will outperform other mediums.

FIRE RESISTANCE

Composite Cable tray is available in various resin systems, two of which meet the Class 1 flame spread rating of 25 or less, in accordance with ASTM E-84 Tunnel Test Method. If a flame spread of 10 or less is required, it will be available in request.

NON-MAGNETIC

The non-magnetic properties allow the Composite Cable tray to be used in sensitive installations where the inherent magnetic properties of metallic Cable tray would prove unsuitable.

IMPACT RESISTANCE

The impact resistance of Composite Cable tray allows repeated deflection without permanent deformation. A certain amount of deflection can occur with loading. However, once the load is removed, the grating will return to its original shape, unlike metallic Cable tray, which will remain deformed and require costly repairs or replacement.

NON-SPARKING

The non sparking qualities of Composite Cable tray systems are ideally suited for those installations where hydrogen or other combustible gases may be found and which may explode or cause a fire from sparks produced.

MAINTENANCE FREE

The use of Composite Cable tray virtually eliminates maintenance costs since painting is not required and UV inhibitors protect against degradation from the sun.

LIGHTWEIGHT

Composite Cable tray weighs about one-quarter as much as steel Cable tray. So it needs few men for handling. The lightweight design of the Cable tray reduces installation and fabrication costs.

COST SAVINGS

In a review of costs, Composite Cable tray showed significant savings over the use of stainless steel Cable tray, and when consideration is given to 'life cycle costs', the saving over the use of metal Cable tray alternatives is quite considerable.

Office: Iran, Tehran, Ressalat Expy, Bani Hashem st, Sepideh Alley, No.6, Unit 53

www:MTgroup.ir

Tel: +98 21-22942856 Mobile: +98 938 560 1212

E-mail:mtg95.ir@Gmail.com

NON-CONDUCTIVE

Composite Cable trays don't conduct heat or electricity and also protects the cables.

LOW INSTALLATION COSTS

Composite Cable tray weighs considerably less than conventional metal Cable trays and is easier and less expensive to transport, install and remove.

SUPERIOR STRENGTH

The high glass-to-resin ratio of Composite Cable tray provides superior strength and load-bearing characteristics. With structural integrity protected by its unique corrosion resistance capabilities, Composite Cable tray lasts longer than traditional materials.

MECHANICAL STRENGTH

Breaking strength under a lateral force is exceptional. The uni-directional continuous Composite reinforcement offers numerous advantages, including rigidity, shock-resistance and no permanent deformation after overloading. These factors provide excellent mechanical strength and a generous factor of safety. Composite Cable tray is designed for maximum safety in intensive industrial use.

HIGH PERFORMANCE

Composite structural Composite Cable tray materials have demonstrated a proven ability to withstand the harsh side effects of corrosive conditions better than galvanized steel. For many years, composites have been reliably used in traditionally corrosive industries while the cost of material is an important criteria in the design of a project, it does not reflect the total cost of the project. Beyond material purchase price, the engineer also should consider the related costs of installation, maintenance over time and replacement of debilitated materials.

Step Down Plates

Blind End Plate

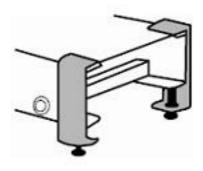

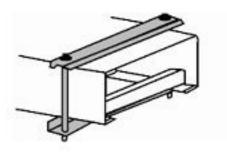

Ladder Drop-out

Standard Cover Clamp

Heavy Duty Cover Clamp

Office: Iran, Tehran, Ressalat Expy, Bani Hashem st, Sepideh Alley, No.6, Unit 53

STANDARDS OF FRP COMPOSITES

The Following Standards are used in composite productions:

| ASTM C-177-85 | Heat Flux |
|----------------|--|
| ASTM D-149-87 | Dielectric Strength |
| ASTM D-229-86 | Testing Rigid Sheet for Electrical Insulation (Ladder) |
| ASTM D-256-87 | Impact Resistance |
| ASTM D-495-84 | Electrical Resistance |
| ASTM D-570-81 | Water Absorption |
| ASTM D-635-81 | Flammability |
| ASTM D-638-87b | Tensile Strength |
| ASTM D-695-85 | Compressive Strength |
| ASTM D-696-79 | Thermal Expansion |
| ASTM D-709-87 | Specifications for Laminated Thermosetting Materials |
| ASTM D-732-85 | Shear Strength by Punch |
| ASTM D-790-86 | Flexural Strength |
| ASTM D-792-86 | Specific Gravity |
| ASTM D-953-87 | Bearing Strength |
| ASTM D-1499-84 | Weathering |
| ASTM D-1505-85 | Density |
| ASTM D-2344-89 | Interlaminar Short Beam Shear Strength |
| ASTM D-2583-87 | Hardness |
| ASTM D-2584-85 | Ignition Loss |
| ASTM D-3647-84 | Classifying Pultruded Shapes |
| ASTM D-3846-85 | In-plane Shear Strength |
| ASTM D-3914-84 | In Plane Shear |
| ASTM D-3916-84 | Tensile |
| ASTM D-3917-88 | Dimensional Tolerances |
| ASTM D-3918-80 | Pultrusion Terms |
| ASTM D-4385-88 | Visual Defects |
| ASTM D-4475-85 | Short Beam Shear Strength |
| ASTM D-4476-90 | Flexural Properties |
| ASTM E-84-87 | Tunnel Beam Test |
| ASTM E-662-83 | Smoke Chamber |
| ASTM E-831-86 | Linear Thermal Expansion (CTE) |
| ASTM F-1092-94 | Handrails |
| ASTM G-23-81 | Weathering |
| ASTM G-53-84 | Weathering |

Office: Iran, Tehran, Ressalat Expy, Bani Hashem st, Sepideh Alley, No.6, Unit 53
